The Two Big Problems with Data

Data 101

Descriptive Statistics

Measures of Center

Measures of Dispersion

Random Variables

Experiments

• An **experiment** is any procedure that can (in principle) be repeated infinitely and has a well-defined set of outcomes

Example

Flip a coin 10 times.

Random Variables

- A random variable (RV) takes on values that are unknown in advance, but determined by an experiment
- A numerical summary of a random outcome

Example

The number of heads from 10 coin flips

Random Variables: Notation

- Random variable X takes on individual values (x_i) from a set of possible values
- Often capital letters to denote RV's
 - lowercase letters for individual values

Let X be the number of Heads from 10 coin flips. $x_i \in \{0, 1, 2, \dots, 10\}$

Discrete Random Variables

• A discrete random variable: takes on a finite/countable set of possible values

Example

Let X be the number of times your computer crashes this semester¹, $x_i \in \{0, 1, 2, 3, 4\}$

Windows

Windows crashed again. I am the Blue Screen of Death. No one hears your screams.

Press any key to terminate the application.
 Press CTRL+ALT+DEL again to restart your computer. You will lose any usaved data in all applications.

Press any key to continue _

Discrete Random Variables: Probability Distribution

• Probability distribution of a R.V. fully lists all the possible values of X and their associated probabilities

x_i	$P(X=x_i)$
0	0.80
1	0.10
2	0.06
3	0.03
4	0.01

Discrete Random Variables: pdf

- Probability distribution function (pdf) summarizes the possible outcomes of \boldsymbol{X} and their probabilities
- Notation: f_X is the pdf of X:

$$f_X = p_i, \quad i = 1, 2, \dots, k$$

- For any real number $x_i, f(x_i)$ is the probability that $X = x_i$
- What is f(0)?
- What is f(3)?

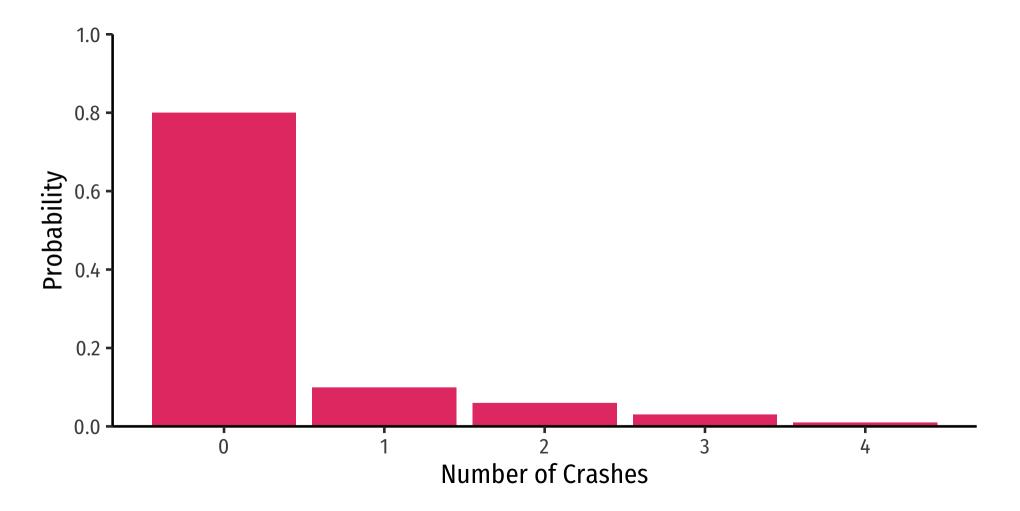

x_i	$P(X=x_i)$
0	0.80
1	0.10
2	0.06
3	0.03
4	0.01

Discrete Random Variables: pdf Graph

Plot

Code

Discrete Random Variables: cdf

- Cumulative distribution function (cdf) lists probability X will be at most (less than or equal to) a given value x_i
- Notation: $F_X = P(X \le x_i)$

x_i	f(x)	F(x)
0	0.80	0.80
1	0.10	0.90
2	0.06	0.96
3	0.03	0.99
4	0.01	1.00

- What is the probability your computer will crash at most once, F(1)?
- What about three times, F(3)?

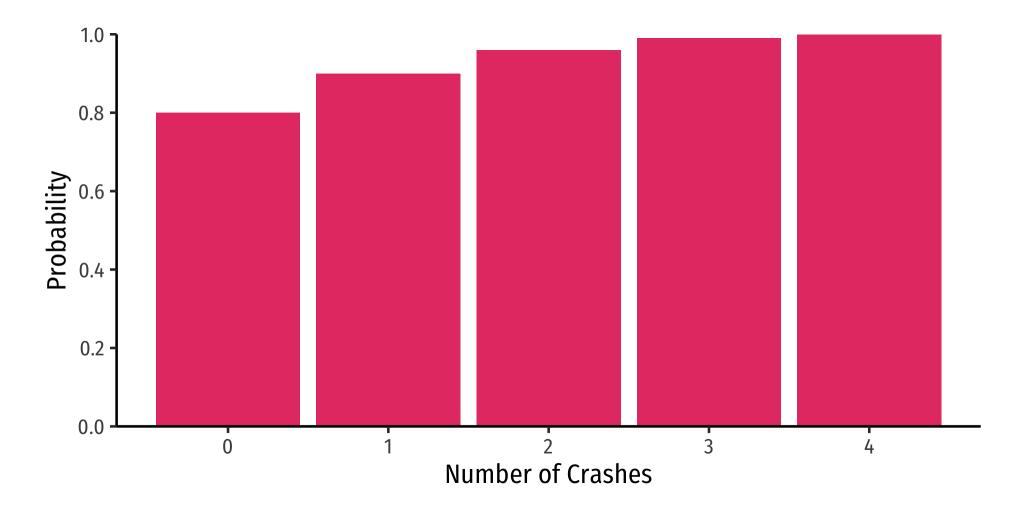

Discrete Random Variables: cdf Graph

Discrete Random Variables: cdf Graph

Plot

Code

Expected Value and Variance

Expected Value of a Random Variable

• Expected value of a random variable X, written $\mathbb{E}(X)$ (and sometimes μ), is the long-run average value of X "expected" after many repetitions

$$\mathbb{E}(X) = \sum_{i=1}^{k} p_i x_i$$

- $\mathbb{E}(X) = p_1 x_1 + p_2 x_2 + \dots + p_k x_k$
- A **probability-weighted average** of X, with each x_i weighted by its associated probability p_i
- Also called the "mean" or "expectation" of X, always denoted either $\mathbb{E}(X)$ or μ_X

Expected Value: Example I

Example

Suppose you lend your friend \$100 at 10% interest. If the loan is repaid, you receive \$110. You estimate that your friend is 99% likely to repay, but there is a default risk of 1% where you get nothing. What is the expected value of repayment?

Expected Value: Example II

Example

Let X be a random variable that is described by the following pdf:

x_i	$P(X=x_i)$
1	0.50
2	0.25
3	0.15
4	0.10

Calculate $\mathbb{E}(X)$.

The Steps to Calculate E(X), Coded

1.85

```
1 # Make a Random Variable called X
2 X \leftarrow tibble(x_i = c(1,2,3,4), \# values of X
3 p_i = c(0.50,0.25,0.15,0.10)) \# probabilities
```

```
1 # Look at tibble
2 X

# A tibble: 4 × 2
    x_i   p_i
    <dbl> <dbl>
1     1     0.5
2     2     0.25
3     3     0.15
4     4     0.1
```

Variance of a Random Variable

• The variance of a random variable X, denoted var(X) or σ_X^2 is:

$$\sigma_X^2 = \mathbb{E}[(x_i - \mu_X)^2]$$

$$= \sum_{i=1}^n (x_i - \mu_X)^2 p_i$$

- This is the expected value of the squared deviations from the mean
 - i.e. the probability-weighted average of the squared deviations

Standard Deviation of a Random Variable

• The **standard deviation** of a random variable X, denoted sd(X) or σ_X is:

$$\sigma_X = \sqrt{\sigma_X^2}$$

This is the average or expected deviation from the mean

Standard Deviation: Example I

Example

What is the standard deviation of computer crashes?

x_i	$P(X=x_i)$
0	0.80
1	0.10
2	0.06
3	0.03
4	0.01

The Steps to Calculate sd(X), Coded I

```
1 # save this for quick use
2 exp_value <- 0.35</pre>
```

```
crashes_2 <- crashes %>%
select(-cum_prob) %>% # we don't need the cdf

# create new columns

mutate(deviations = number - exp_value, # deviations from exp_value

deviations_sq = deviations^2, # square deviations

weighted_devs_sq = prob * deviations_sq) # weight squared deviations by probability
```

The Steps to Calculate sd(X), Coded II

```
2 crashes 2
# A tibble: 5 \times 5
  number prob deviations deviations_sq weighted_devs_sq
   <dbl> <dbl>
                   <dbl>
                                 <dbl>
                                                  <dbl>
       0.8
                   -0.35
                                 0.122
                                                 0.098
                   0.65
                                 0.423
                                                 0.0423
      1 0.1
      2 0.06
                   1.65
                                 2.72
                                                 0.163
                   2.65
      3 0.03
                                 7.02
                                                 0.211
       4 0.01
                    3.65
                                13.3
                                                 0.133
```

1 # look at what we made

The Steps to Calculate sd(X), Coded III

Standard Deviation: Example II

Example

What is the standard deviation of the random variable we saw before?

x_i	$P(X=x_i)$
1	0.50
2	0.25
3	0.15
4	0.10

Hint: you already found it's expected value.

Continuous Random Variables

Continuous Random Variables

- Continuous random variables can take on an uncountable (infinite) number of values
- So many values that the probability of any specific value is infinitely small:

$$P(X = x_i) \rightarrow 0$$

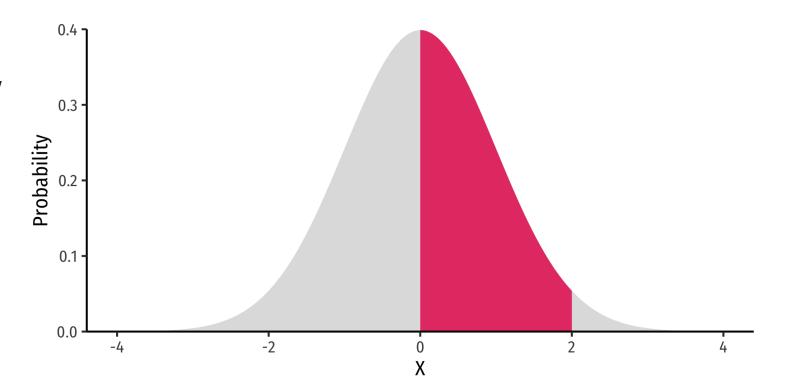

• Instead, we focus on a *range* of values it might take on

Continuous Random Variables: pdf I

- Probability density function (pdf) of a continuous variable represents the probability between two values as the area under a curve
- The total area under the curve is 1
- Since P(a) = 0 and P(b) = 0, $P(a < X < b) = P(a \le X \le b)$
- See today's appendix for how to graph math/stats functions in ggplot!

\bigcirc

Example

$$P(0 \le X \le 2)$$

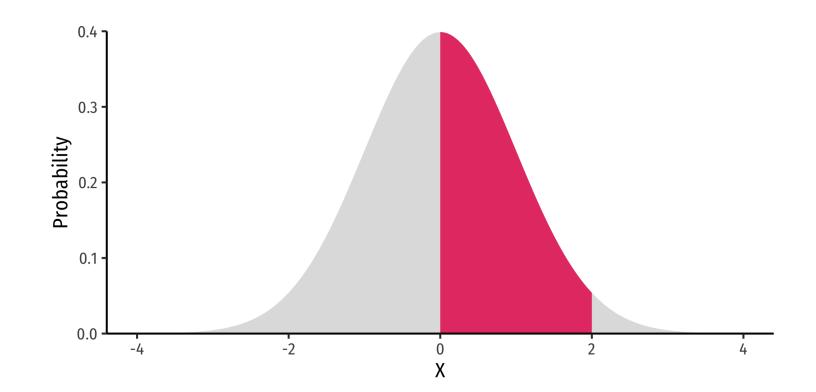

Continuous Random Variables: pdf II

• FYI using calculus:

$$P(a \le X \le b) = \int_a^b f(x)dx$$

Complicated: software or (old fashioned!)
 probability tables to calculate

(E)

Example

$$P(0 \le X \le 2$$

Continuous Random Variables: cdf I

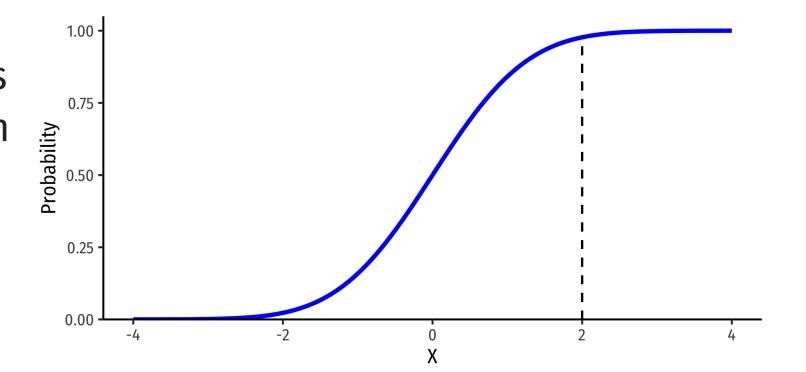

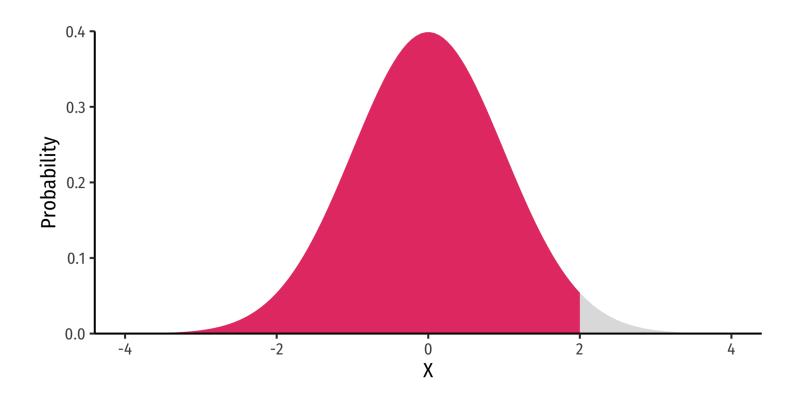

• The cumulative density function (cdf) describes the area under the pdf for all values less than or equal to (i.e. to the left of) a given value, k

$$P(X \le k)$$

 $P(X \le 2)$

Continuous Random Variables: cdf II

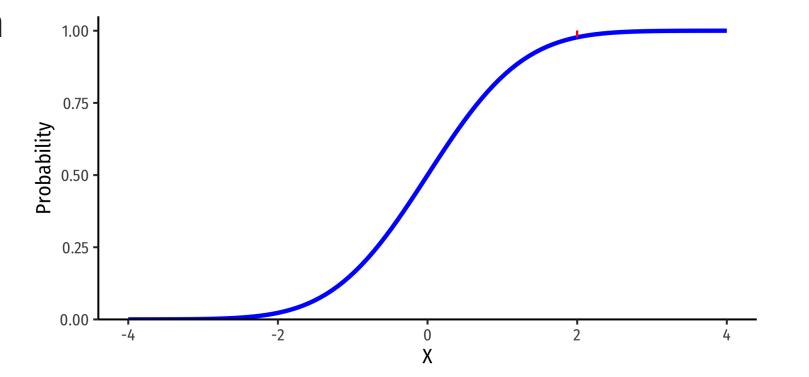

• Note: to find probability of values *greater* than or equal to (to the right of) a given value k:

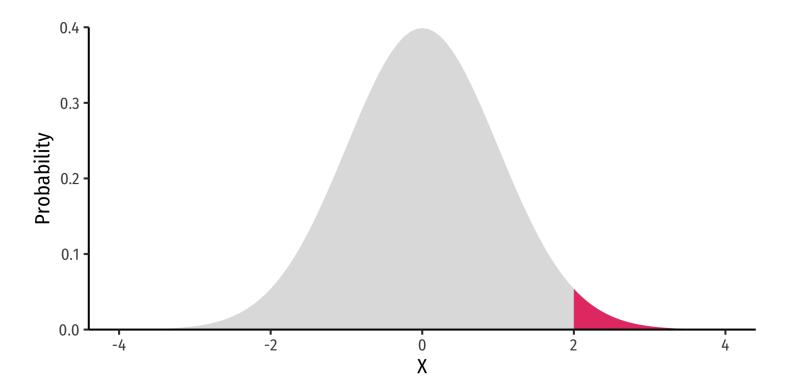

$$P(X \ge k) = 1 - P(X \le k)$$

Example

$$P(X \ge 2) = 1 - P(X \le 2)$$

 $P(X \ge 2)$ = area under the pdf curve to the right of 2

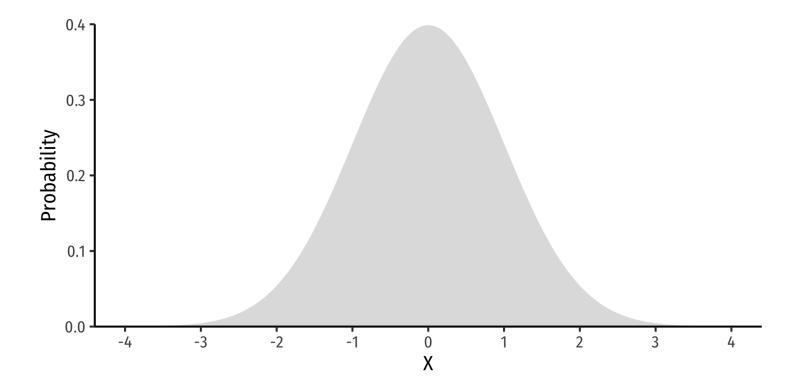

The Normal Distribution

The Normal Distribution

• The Gaussian or normal distribution is the most useful type of probability distribution

$$X \sim N(\mu, \sigma)$$

- "X is distributed Normally with mean μ and standard deviation σ "
- Continuous, symmetric, unimodal

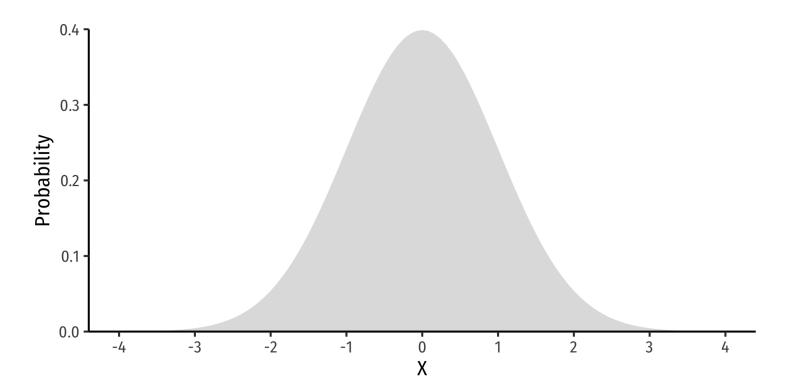

The Normal Distribution: pdf

• FYI: The pdf of $X \sim N(\mu, \sigma)$ is

$$P(X=k) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{1}{2}\left(\frac{(k-\mu)}{\sigma}\right)^2}$$

 Do not try and learn this, we have software and (previously tables) to calculate pdfs and cdfs

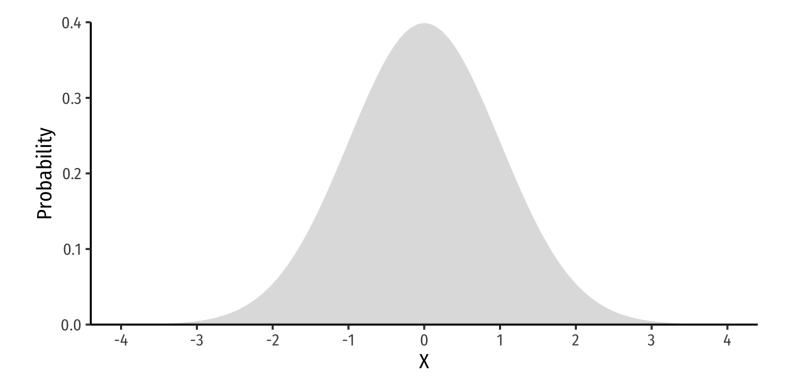

The Standard Normal Distribution

• The **standard** normal distribution (often referred to as Z) has mean 0 and standard deviation 1

$$Z \sim N(0, 1)$$

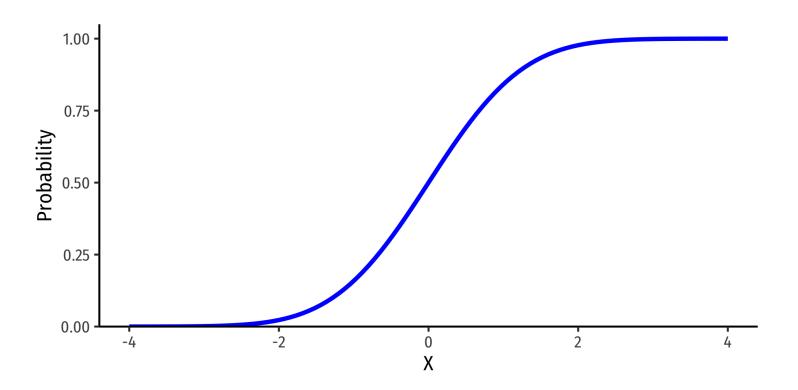

The Standard Normal cdf

• The **standard** normal cdf, often referred to as Φ :

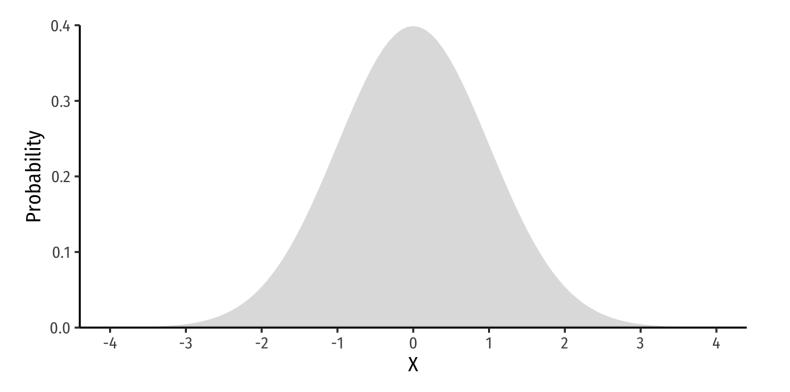

$$\Phi(k) = P(Z \le k)$$

(again, the area under the pdf curve to the left of some value k)

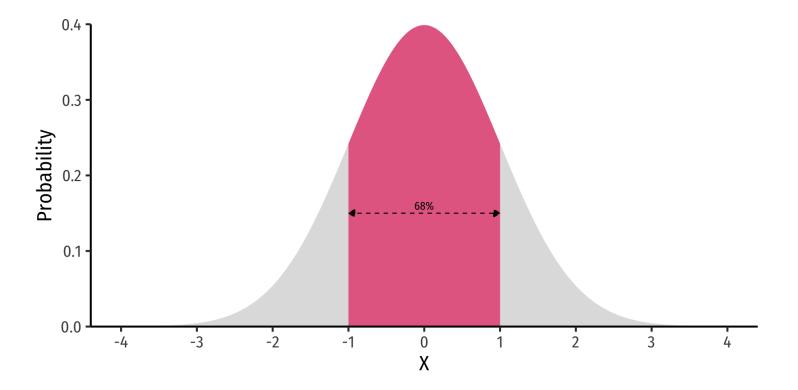

• 68-95-99.7% empirical rule: for a normal distribution:

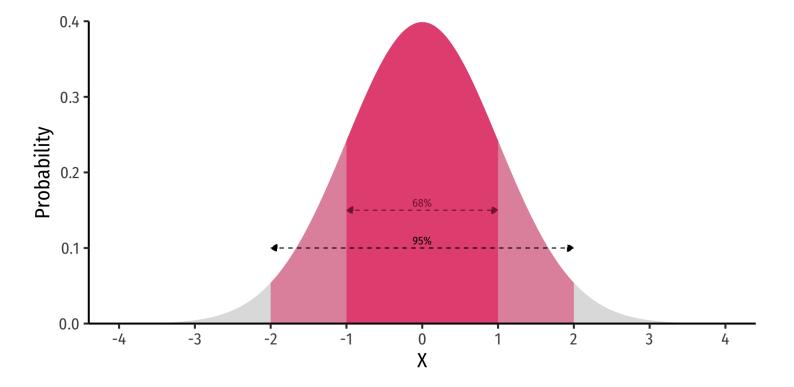

- 68-95-99.7% empirical rule: for a normal distribution:
- $P(\mu 1\sigma \le X \le \mu + 1\sigma) \approx 68\%$

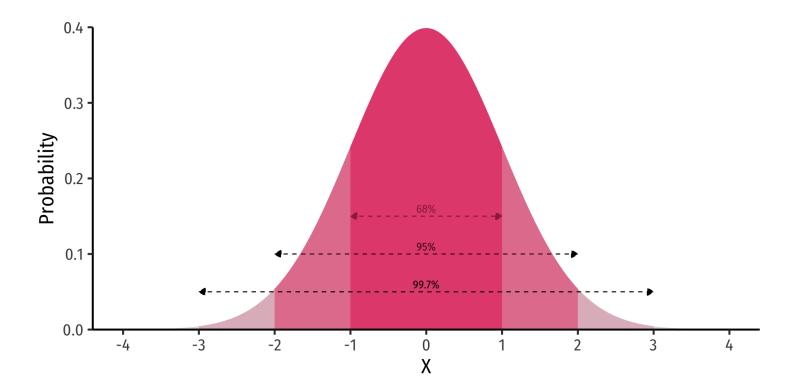

- 68-95-99.7% empirical rule: for a normal distribution:
- $P(\mu 1\sigma \le X \le \mu + 1\sigma) \approx 68\%$
- $P(\mu 2\sigma \le X \le \mu + 2\sigma) \approx 95\%$

- 68-95-99.7% empirical rule: for a normal distribution:
- $P(\mu 1\sigma \le X \le \mu + 1\sigma) \approx 68\%$
- $P(\mu 2\sigma \le X \le \mu + 2\sigma) \approx 95\%$
- $P(\mu 3\sigma \le X \le \mu + 3\sigma) \approx 99.7\%$
- 68/95/99.7% of observations fall within 1/2/3 standard deviations of the mean

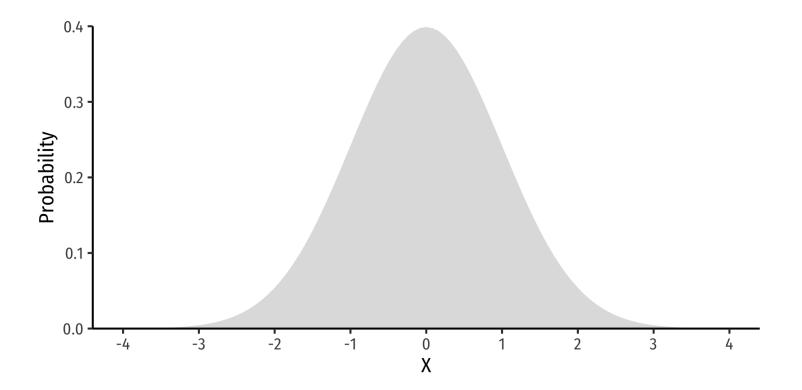

Standardizing Normal Distributions

• We can take any normal distribution (for any μ , σ) and **standardize** it to the standard normal distribution by taking the **Z-score** of any value, x_i :

$$Z = \frac{x_i - \mu}{\sigma}$$

- Subtract any value by the distribution's mean and divide by standard deviation
- Z: number of standard deviations x_i value is away from the mean

Standardizing Normal Distributions: Example I

\bigcirc

Example

On August 8, 2011, the Dow dropped 634.8 points, sending shock waves through the financial community. Assume that during mid-2011 to mid-2012 the daily change for the Dow is normally distributed, with the mean daily change of 1.87 points and a standard deviation of 155.28 points. What is the Z-score?

$$Z = \frac{X - \mu}{\sigma}$$

$$Z = \frac{634.8 - 1.87}{155.28}$$

$$Z = -4.1$$

This is 4.1 standard deviations (σ) beneath the mean, an extremely low probability event.

Standardizing Normal Distributions: Example II

\bigcirc

Example

In the last quarter of 2021, a group of 64 mutual funds had a mean return of 2.4% with a standard deviation of 5.6%. These returns can be approximated by a normal distribution.

What percent of the funds would you expect to be earning between -3.2% and 8.0% returns?

Convert to standard normal to find Z-scores for 8 and -3.2.

$$P(-3.2 < X < 8)$$

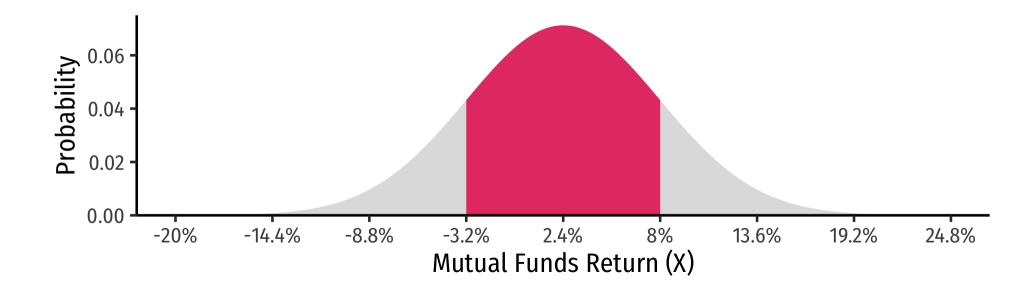

$$P(\frac{-3.2 - 2.4}{5.6} < \frac{X - 2.4}{5.6} < \frac{8 - 2.4}{5.6})$$

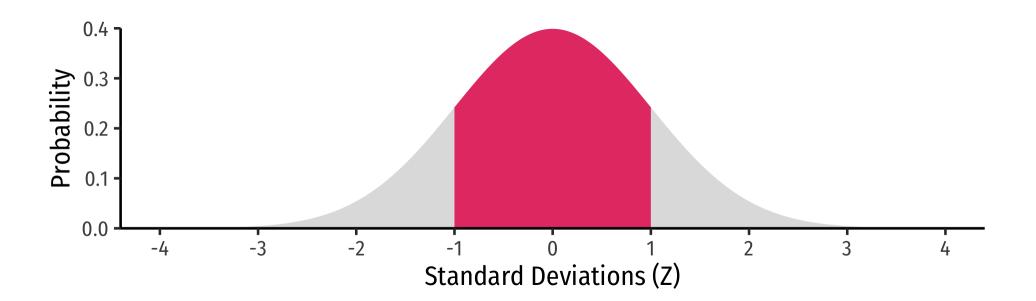

$$P(-1 < Z < 1)$$

$$P(X \pm 1\sigma) = 0.68$$

Standardizing Normal Distributions: Example II

Standardizing Normal Distributions: Example III

\bigcirc

Example

In the last quarter of 2015, a group of 64 mutual funds had a mean return of 2.4% with a standard deviation of 5.6%. These returns can be approximated by a normal distribution.

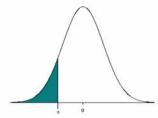

- 1. What percent of the funds would you expect to be earning between -3.2% and 8.0% returns?
- 2. What percent of the funds would you expect to be earning 2.4% or less?
- 3. What percent of the funds would you expect to be earning between -8.8% and 13.6%?
- 4. What percent of the funds would you expect to be earning returns greater than 13.6%?

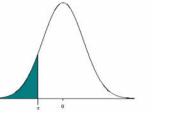

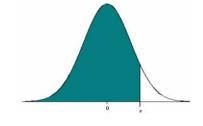

How do we actually find the probabilities for Z-scores?

Table of Standard Normal Probabilities for Negative Z-scores

Note that the probabilities given in this table represent the area to the LEFT of the z-score. The area to the RIGHT of a z-score = 1 – the area to the LEFT of the z-score

Finding Z-score Probabilities I

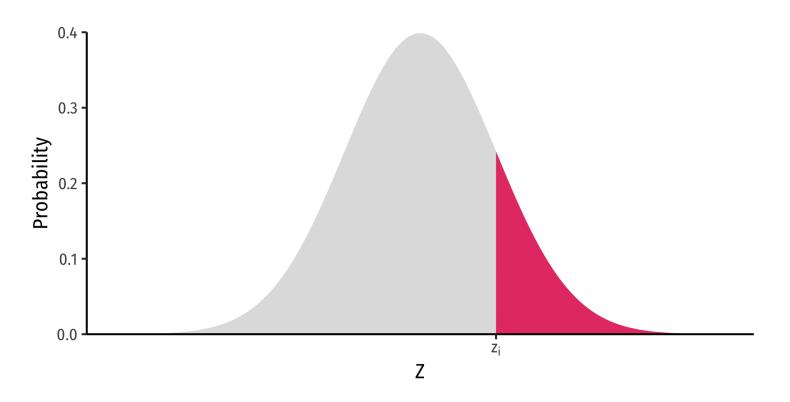

Probability to the **left** of z_i

$$P(Z \le z_i) = \underbrace{\Phi(z_i)}_{\text{cdf of } z_i}$$

Probability to the **right** of z_i

$$P(Z \ge z_i) = 1 - \underbrace{\Phi(z_i)}_{\text{cdf of } z_i}$$

Finding Z-score Probabilities II

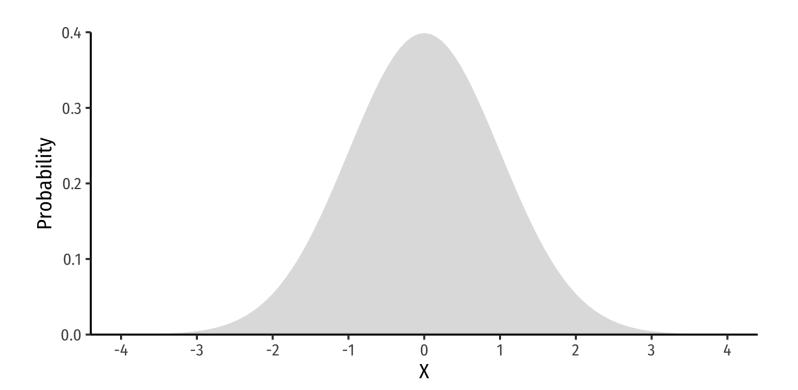

Probability **between** z_1 and z_2

$$P(z_1 \ge Z \ge z_2) = \underbrace{\Phi(z_2)}_{\text{cdf of } z_2} - \underbrace{\Phi(z_1)}_{\text{cdf of } z_1}$$

Finding Z-score Probabilities III

- pnorm() calculates probabilities with a normal distribution with arguments:
 - x = the value
 - mean = the mean
 - sd = the standard deviation
 - lower.tail =
 - TRUE if looking at area to LEFT of value
 - FALSE if looking at area to RIGHT of value

Finding Z-score Probabilities IV

\bigcirc

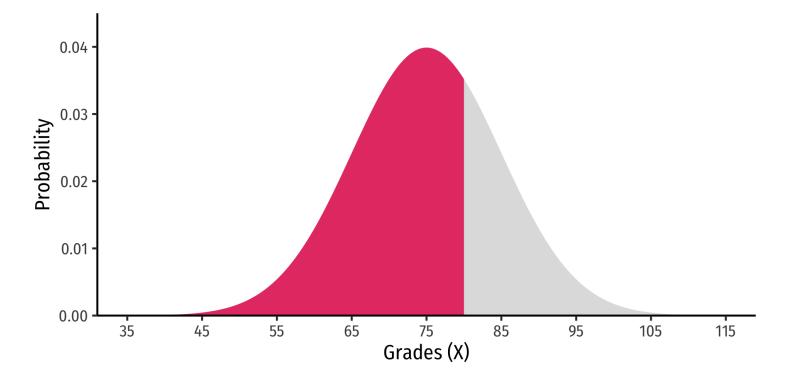

Example

[1] 0.3085375

Let the distribution of grades be normal, with mean 75 and standard deviation 10.

• Probability a student gets at least an 80

```
pnorm(80,
mean = 75,
sd = 10,
lower.tail = FALSE) # looking to right
```

Finding Z-score Probabilities V

Q

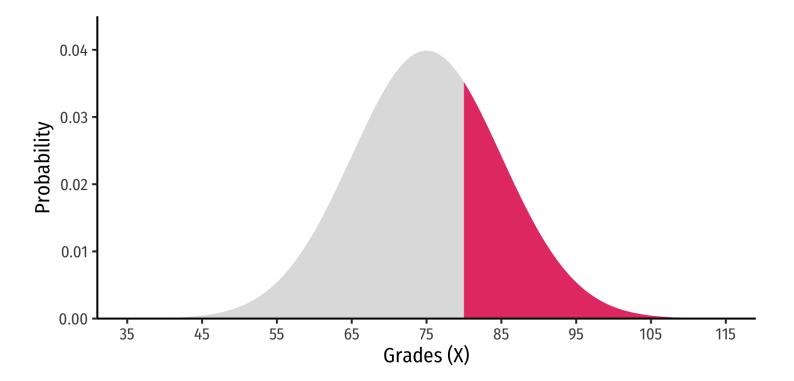

Example

[1] 0.6914625

Let the distribution of grades be normal, with mean 75 and standard deviation 10.

• Probability a student gets at most an 80

```
pnorm(80,
mean = 75,
sd = 10,
lower.tail = TRUE) # looking to left
```

Finding Z-score Probabilities VI

Example

Let the distribution of grades be normal, with mean 75 and standard deviation 10.

Probability a student gets between 65 and 85

```
# subtract two left tails!
pnorm(85, # larger number first!
mean = 75,
sd = 10,
lower.tail = TRUE) - # looking to left, & SU
pnorm(65, # smaller number second!
mean = 75,
sd = 10,
lower.tail = TRUE) #looking to left
```
